## Explain what the scanning strategy is.

The scanning strategy, in the context of reading comprehension, refers to a technique used by readers to quickly search through a text to locate specific information or key details without necessarily reading every word or sentence in detail. Instead of reading linearly from start to finish, readers employing the scanning strategy move their eyes rapidly across the text, focusing on headings, keywords, and other visual cues that signal the presence of relevant information. . This approach is particularly useful when readers have a specific question or information need and want to locate the answer efficiently. Scanning allows readers to save time by bypassing irrelevant sections of text and zeroing in on the sections that contain the information they are seeking. It is commonly used in tasks such as finding specific facts, dates, names, or statistics in textbooks, articles, or other informational materials.
